This manual has been reproduced as close to the original as possible.
If you think it strange that a paragraph suddenly stops on one page and continues on the next it is because that is how it was in the original manual.

We attempted to get permission from Gilsoft, but unfortunately we never got in touch with them.
I suppose the address is a bit old now !
We hope this manual is appreciated.

## What is Adventure?

Adventure can be described asa computerised version of the game Dungeons \& Dragons. In Dungeons \& Dragons one person is nominated as the dungeon master, and he invents a dungeon for other playersto explore and try to retrieve hidden treasures which a re usually protected by monsters of various shapes a nd sizes. Each player notifies his proposed actions to the dungeon master who decides on the outcome, sometimes with the help of dice to introduce a random element.

In Adventure the computer takesthe place of the dungeon master and the player or players explore a predefined dungeon. Most Adventures will conta in a vocabulary of words which the computer 'understands', a variety of locations which a player may wander around and objects which have to be used in the correct way to enable the Adventure to be solved. The computer will desc ribe a situation to the player and invite him to decide on a course of action. The computer then tells the player the result of his action.

Everyone who plays Adventure has the problem of making the computer understand their commands The computer will only have a limited vocabulary of perhapsa few hundred words and 'finding the right words' can sometimes he a problem, for example, if you are playing Dungeons \& Dragons and the dungeon mastertells you "There is a lamp nearby" then if you decide to "PICK UP THE UGHT" the dungeon master should know what you mean. If the same situation occurs when playing Adventure the computer may understand "GETLAMP" but may not know that UGHTmeans, on this occasion, the same as LAMP or that PICK UP means the same as GET. Even so, most players will very quickly get the knack of 'finding the correct words'. However, it should be noted that it is up to the Adventure designerto decide which words are included in the computer's vocabulary.

## Getting Started

The Quill Adventure system is made up of three parts:-
a) A database which will contain all the information relevant to an adventure
b) A database Editor which enables data to be inserted into, a mended in or deleted from the database.
c) An Interpreter (this is the dungeon master) which uses the data in the database to execute your adventure.

To load The Quill use LOAD "". The introductory screen will tell you the address of the User Defined Graphics (UDG 's) and you should make a note of this as you will need it if you ever want to change them.

Part 1 of this manual will introduce you gently to The Quill, from simple location descriptions through to complex condition tests and actions. It is strongly recommended that you work all the way through Part 1 before attempting to write your own adventures. Part 2 contains a detailed description of The Quill for reference.

## Part 1

## The Main Menu

When The Quill hasloaded you will be presented with the Editor's Main Menu which gives you a number of options. Some of these optionse.g. Bytes Spare, will perform a function and retum to the Main Menu while otherse.g. Location Text, will give you a sub menu. The REIURN TO BASIC option is an exception to this as it executes the BASIC NEW command which destroys The Quill.

## The Input Routine

The input routine used in the Editor is very similar to the BASIC 'INPUTUNE' routine and the keyboard responds in exactly the same way. In partic ular you should note that CAPS SHIFT 1 will c lear the input buffer while CAPS SHIFT6 gives the error message 'STOP in INPUT. Try typing in a few characters and then pressing CAPS SHIFT1 then type in a few more characters and press CAPS SHIFT6. Errormessages appearat the bottom of the sc reen in a similar way to BASIC's error messages and pressing a ny key will retum you to a menu.

Whenever you press ENTER the Editor checks that what you have typed in is valid i.e. it checks the syntax. If the Editor finds a syntax error it is indicated, in the same way as BASIC, by a flashing ? following the error. However, unlike BASIC, the Editor positions the cursor immedia tely after the fla shing? so that the cursor is in the vicinity of the error. On the Main Menu the only valid options are single capital letters in the range $A$ to $Q$ and the copyright symbol. Try typing in 3 and pressing ENTER, then delete the 3 and type in ABC followed by ENTER. In each case a syntax error will be detected. Note that the lowercase letters a to $q$ will also give a syntax error but the Editor will place the cursor in C mode i.e. CAPS LOCK, whenevera menu is displayed.

## Bytes Spare

Let's now try one of the options on the Main Menu. If you clear the input buffer (CAPS SHIFT 1), then type O for Bytes Spare and press ENTER you will get a display which tells you how many bytes are unused in the database and the address at which they start. The start address is only of use if you are writing an adventure to fit into a 16K Spectrum. If the spare bytes start before 32769 the adventure will run in a 16 K machine.

## Permanent Colours

When The Quill is loaded it behaves as if the BASIC command INK 9: PAPER 1: BORDER 1: FLASH 0: BRIG HT0: INVERSE 0: OVER 0 had been executed. The values of INK, PAPER \& BORDER can be changed by selecting option Q on the Main Menu. Note that CAPS SHIFT 6 can be used at any time to retum to the menu. INK 9 (i.e. contrast) is recommended. Try changing the colours and in partic ular try having different BORDER \& PAPER colours as some people find this helpful. All of the messages in this section e.g. Input INK (0-9), are printed with blue paper and white ink. Try changing INK \& PAPER to the same value and you will realise why. J ust remember that 'Pemmanent Colours' is still option Q on the Main Menu even if you can't see the menu.

## Save, Verify \& Load Database

These three options on the Main Menu allow the database to be saved to or reloaded from tape and in each case you will be prompted to "Type in name of file". When loading or verifying, the Spectrum will search for a file of bytes with the name specified a nd then load or verify it. If you enter a null filena me i.e. just press ENTER, the Spectrum will load or verify the first file of bytes it finds on the tape. However, when saving, a null filename will produce the errormessage Invalid file name. Care should be taken when using Load Database with a null filename because it does the equivalent of the BASIC command LOAD "" CODE i.e. it will load a ny file of bytes. The BREAK key may be used to intemupt a save, verify orload but if it is used to intemupt a load, or a Tape Error is detected during a load, then the database will be comupt. Be very careful with a comupt database asit can easily cause the Editor \& Interpreter to become comupt. In fact the only safe Editor command with a comupt database is Load Database and this should be used until a database is loaded successfully.

## Setting up an Adventure

The following sections of Part 1 of this manual will give you some practical experience of using The Quill to set up an adventure. Each section depends on entries having been made to the database in earlier sections so you have to work through it step by step. If you wish to break off part of the way through, please save the database to tape so that you can continue later where you left off.
A map of the mini adventure we are going to set up is shown in figure 1 and the objective of the adventure is to find the jewel and place it in the Dining Room. The map shows all of the locations in the adventure and how they are interconnected. The locations have all been given a location number, which is shown in the comer, and the position of va rious objects is indic ated.

Figure 1 - Map of the Adventure

Before we start to set up the adventure make sure that the database is in the state it was when The Quill was loaded. The PAPER and BORDER colours should be set to 1 and INK should be set to 9 (contrast).

## The Location Texts

The descriptions we will use foreach location are as follows:-
Location 0
I am in a Hall. The Kitchen is to the East, the Bedroom to the West and the Lounge to the South. Steps lead Down to the Cellar.

## Location 1

I am in the Kitchen. The Hall is to the West and the Dining room is to the South.
Location 2
I am in the Dining Room. The Kitc hen is to the North and the Lounge to the West.

## Location 3

I am in the Lounge. To the North is the Hall while the Dining Room is to the East.
Location 4
I am in the Bedroom. The Hall is to the East and a bed is against the North wall.

## Location 5

I am in the Cellar. Stepslead Up to the Hall.

If you type in C on the Main Menu the Location Text menu will be displayed and you will see that location texts can be Inserted, Amended or Printed. P is used to print on the screen while L is used to print on the printer. P or Lby itself will start printing with the text forlocation 0. P and Lcan also be followed by a location number (locno.) and if that location exists printing will start with the text for that location. The P or Land the locno. must be separated by at least one space and if the locno. does not exist a syntax error will be detected.

Type in P followed by ENTER on the Location Text menu and you will see that a description is already present for location 0 . The only reason for this is that the programming of The Quill was much simpler if location 0 was always present. The text that is present is not important but it does show some of the things that can be entered from the keyboard e.g. FLASH. Note that PAPER 0 and PAPER 6 have been used and that the use of INK 9 as a permanent colour has automatic ally changed the INK colour.

As a text is already present for location 0 we will have to amend it to the text required for our mini adventure. You will see from the Location Text menu that to amend a location text, A followed by a locno. must be entered. Please now enter A 0 and the existing text for that location will be copied
to the input buffer and displayed at the bottom of the screen followed by a cursor. There are a number of points to be noted here. Firstly, because you are amending text, the Editor haschanged the cursorto Lmode i.e. lowercase. Secondly, due to an inconsistency in the BASIC ROM, INK 9 behaves differently in the bottom of the screen and the INK colours are not changed as you would expect. The third point to note is that each line of the text ends with a CHR\$ 6 to reduce the amount of memory that the text occupies. A CHR $\$ 6$ behaves in the same way as a comma in a BASIC PRINT statement. If you now use CAPS SHIFT 5 and CAPS SHIFT 8 to move the cursor through the text you will see the effect of the CHR\$ 6 . Please now position the cursor at the beginning of the last line and then delete the CHR\$ 6 at the end of the previous line using CAPS SHIFTO. To reinsert the CHR\$ 6 is a little awkward but it is worth the effort involved because it can considerably reduce the amount of memory used and it also makes moving the cursorthrough the text much easier. To insert a CHR $\$ 6$, change the cursor to E (extended mode) by pressing CAPS SHIFT and SYMBOL SHIFT together, then press the 6 key to insert the control characters for PAPER 6 (i.e. CHR\$ 17 and CHR\$ 6). If you now use the delete key once you will delete the CHR\$ 17 and leave the CHR\$ 6. Experiment with the insertion of CHR\$ 6 and try inserting multiple CHR\$ 6's to create blank lines in the text.

Getting back to our mini adventure use CAPS SHIFT 1 to clearthe input buffer and then type in the text we need forour location 0 i.e. the Hall. Use CHR $\$ 6$ where appropriate and, if you like, put the compass directions in INVERSE. When you have typed it in press ENTER to amend the database. Note that the database is not amended until you press ENTER and that the use of CAPSSHIFT6 at any time before pressing ENTER will leave the database unchanged.

The texts for the other locations in our mini adventure now have to be inserted by using the I option on the Location Text menu. Notice that the I is not followed by a locno. When you use I the Editor automatic ally allocates the next location number in sequence. Type in I followed by ENTER and the Editor will tell you which location number has been allocated ( 1 in this case) and display a cursorat the bottom of the screen. It is important that you realise that a null entry for the location number being inserted has already been made in the database and that if you were to use CAPS SHIFT 6 at this stage (do not do this now) the null entry would still remain.

Type in the text that we need for our location 1 and press ENTER which will change the null entry already inserted to the text you have typed in. You should now be able to insert the texts for locations 2 to 5 and then print them to check that they are correct. If you have made any mistakes then please amend the texts to correct the errors. You might also like to try P followed by a locno. e.g. P 2, to start printing with the text for location 2.

You should have inserted the location texts for locations 0 to 5 and retumed to the Main Menu before continuing with the next part.

## The Movements

The interconnections between our 6 locations can now be entered into the database and these are placed in the Movement Table. If you select D on the Main Menu the Movement Table menu will be displayed and you will see that entries can he amended or printed. Notice that entries cannot be inserted. This is bec a use when you insert a location text for a location the Editorautomatic ally creates a nullentry for that location in the Movement Table. If you type in P on the Movement Table menu you should see that null entries do actually exist for our loc ations 0 to 5 .

Refer back to the map of our mini adventure in figure 1 and you will see for location 0 that:-

$$
\begin{array}{cl}
\text { EAST } & \text { goes to location } 1 \\
\text { DOWN } & \text { goesto location 5 } \\
\text { WEST } & \text { goesto location } 4 \\
\text { \& SOUTH } & \text { goesto location } 3 .
\end{array}
$$

Going back to the Movement Table menu type in A 0 to amend the entry for location 0 . When 'Movements from location 0 ' is printed at the top of the screen, type in (exactly)

EST 1 DOWN 5 WEST9 SOUTH 3 and press ENTER.
If you did type it in exactly you should get a syntaxemor after ESTbecause it is not in the database's voca bulary. If you correct EST to EAST a nd press ENTER again you should get a syntaxerror after the 9 because the Editor knows that there is no location 9. Change the 9 to 4 and you should then have EAST 1 DOWN 5 WEST 4 SOUTH 3.

Pressing ENTER now will a mend the existing database entry.
Now type in P on the Movement Table menu and you will see that the entry for location 0 reads:-

| E | TO | 1 |
| :--- | :--- | :--- |
| D | TO | 5 |
| W | TO | 4 |
| S | TO | 3 |

The Editor knows that E is a synonym of EAST(i.e. E means the same asEAST). D is a synonym of DOWN etc. and it alwa ys prefers to use the abbreviation or shorter synonym. We will deal with synonyms in more detail when we get to the section on the vocabulary.

If you now wanted to amend the entry for location 0 it would be displayed at the bottom of the screen as E1D 5 W 4 S3. Type in A 0 on the Movement Menu to have a look; you can then get back to the menu by using CAPS SHIFT6 or ENTER. If you use ENTER the Editor will copy the input buffer into the database and tell you it has a mended the entry even though it hasn't actually changed. Note that you could have typed in the abbreviations initially.

The Movement Table entries we need for our mini adventure are:-

| Location 0 | E1D5W4S3 |
| :--- | :--- |
| Location 1 | S2W0 |
| Location 2 | N1W3 |
| Location 3 | N0E2 |
| Location 4 | E0 |
| Location5 | U0 |

Check these with the map and then amend the Movement Table entries for locations 1 to 5 using the Movement Table menu. You can print the entries to check that they are correct if you wish.

## Testing the Adventure

Now that you have entered the location texts and the movements it is time to test the adventure, so select L on the Main Menu. You will be asked whether you require diagnostics and you should reply $\mathrm{N} \&$ ENTER or just ENTER. Note that the adventure always begins at location 0 . You should be able to move to all of our locations using the full wordse.g. EAST, or the abbreviations e.g. E. When you are in the bedroom try typing in the following commands:-

| GO WEST | will get the reply I can't go in that direction. |
| :---: | :---: |
| GETJEWEL LE ON THE BED | will give Ican't. |
|  |  |
| \& GO TO THE HALL | will give I don't understand |
| REDESCRIBE LOCATION |  |
| or REDESC RIBEor K |  |
|  | will print the location description again. |
| TAKE INVENTORY |  |
| or INVENTORY |  |
| orl | will give a list of what you're carrying |
|  | (nothing). |

To retum to the Editor use the word QUITand if you have found any errors in the location texts or the movements then use the Editor to correct them. If you would like to try out the diagnostics then select Lagain on the Main Menu and reply Y to the prompt. The diagnostics will not help you much at this stage but you should note that the number in INVERSE in the bottom comer of the screen is the number of the current location. The other 31 numbers (all 0 at the moment) are the values of, what are called, the userflags and they will be explained in a later section.

## The Objects

An object is anything that can be manipulated e.g. a key, or moved from place to place orchanged from one thing into a nothere.g. a torch into a lit torch. Most of the objects in our mini adventure are shown on the map in figure 1 but a full list showing the object number, the description needed and the position of the object at the start of the adventure is asfollows:-
objno. Text

| Object 0 | A lit torch. | not created |
| :--- | :--- | :--- |
| Object 1 | A torch. | 1 |
| Object 2 | An apple. | 2 |
| Object 3 | A sharp knife. | 2 |
| Object 4 | A television. | 3 |
| Object 5 | A coat. | 0 |
| Object 6 | A deerstalker hat. | 0 |
| Object 7 | A key. | 3 |
| Object 8 | A safe. | 5 |
| Object 9 | A jewel. | not created |
| Object 10 | An open safe. | not created |
| Object 11 | A walking stick. | camied |

So, the (unlit) torch sta rts out at the kitc hen, the walking stick sta rts off being camied and the jewel (which can't be seen because it's in the safe) starts off as not created. Notice that there are two descriptions for the safe and that it is treated as two separate objects. When the safe is opened Object 8 will be destroyed and Object 10 will be created, while the reverse will happen if the safe is closed. Similarly the torch is really two objects which will he swapped over when the torch is switched on or off.

## The Object Texts

The descriptions of the objects are entered in exactly the same way as the descriptions of the locations. If you select E on the Main Menu the Object Text menu will he displayed and you will see that it is the same as the Location Text menu except that locno. has been replaced with objno. i.e. object number. If you print the object texts $(P)$ you may not be surprised to find that an Object 0 already exists. Amend the text of Object 0 so that it reads"A lit torch." a nd use a different PAPER colour to your permanent PAPER colour. The table in Chapter 16 of the Spectrum manual will expla in how to do this. Then insert the texts for objects 1-11 so that all the object texts use the same PAPER colour. After you have printed the texts, checked and corrected them please retum to the Main Menu.

## The Object Start Locations

Now that the object texts have been inserted into the database we can go about placing the objects where they will be at the start of the adventure. Type in 1 on the Ma in Menu to select the Object Start Location menu and you will see that the entries can he amended or printed. Entriescannot be inserted because when you insert an object text for an object the Editor a utomatic ally inserts an entry of 'not created' for that object in the Object Start Location Table. If you print the Object Start Location entries you should see that our 12 objects ( $0-11$ ) are all 'not created'. To a mend the entry for object 7 so that it starts the adventure at location 3 type in A 73 on the Object Start Location menu. 252, 253 \& 254 are some special loc nos which mean not created, wom \& caried respectively so to a mend the entry for object 11 so that it sta rts off being caried type in A 11254.

Refer back to our list of objects and their start locations and amend all the other entries that need to be changed. You can then print the entries again to check that they are correct. Note that if you type A 0252 (for instance) the Editor will print 'Amended' even though the entry hasn't changed.

## Testing Again

It's time to test the adventure again to check that the objects are where they should be and have the correct descriptions so select Lon the Main Menu. When you are in the adventure type in INVENTORY or I to check that you are carying the walking stick and use the map in figure 1 to check that the otherobjects are at the correct locations.

If you asked fordiagnostics you will see that the second number is now set to 1 . The Interpreter which is part of The Quill contains 33, of what are termed, user flags and these will he explained in more detail in a latersection. However, as a very brief introduction, these flags are numbered from 0 to 32 and may contain values in the range 0-255. When you ask fordiagnostics the values of the first 31 flags ( 0 to 30 ) are printed at the bottom of the screen followed, in INVERSE, by the current location number. Flag 1 i.e. the second flag, is used to contain a count of the number of objects camied and as one object is camied in this case, Flag 1 has the value 1.

## The Vocabulary

One section of the database contains the vocabulary and this will hold an entry for every word that the computer is to understand. The Vocabulary menu is selected by typing in A on the Main Menu and it allows for words to be inserted and deleted, for the vocabulary to be printed and for the synonyms of a word to be displayed. Synonyms were mentioned earlier when we discovered that the Editor knew that EAST and E meant the same thing. If you print the vocabulary you will see that there are over 30 entries already present and these relate to words which will be needed in most adventures. Each entry consists of up to four letters followed by a number (or word value) and entries with the same word value are synonyms.

The entries in the vocabulary will either hold a whole word e.g. UP, or, if the word has more than four letters, just the first four letters e.g. ASCE(ND). This has the advantage of using up only a little memory and it also reduces the amount of typing the person playing the adventure has to do because he or she will soon leam that only the first four letters of each word are signific ant. The disadvantage, of course, is that you can't have two words with different meanings which start with the same four letters. This rarely causes problems but note that when you are playing an adventure and want to go NORTHEAST you have to type in NE as the vocabulary says that NORTH is a synonym of N .

Take a look through the vocabulary and you should be able to spot all the words we used when we were doing the Movement Table and in fact the Movement Table can only contain words that are in the vocabulary. Getting back to the Vocabulary menu, type in SASCEND to see the synonyms of the word ascend (Note that SASC E is sufficient). Then try inserting the word ORANGE with the value 200 i.e. I ORANGE 200 or I ORAN 200. We haven't an
orange in our adventure so delete the entry using D ORAN. Try inserting a word that is already present e.g. I STOP 62 and deleting a word that isn't present e.g. D SPECTRUM. We'll come back to the vocabulary after we've found out what the Interpreter does when a command istyped in.

## Decoding the Players command

Each time the playertypes in a command during an adventure the Interpreter has to decode it. It does this by searching along the command for words which are in it's vocabulary. The word value of the first word recognised is stored in a variable called W1 and simila rly the word value of the second word recognised in W2. This means that commands like TURN ON THE TORCH can be reduced to ON TORCH provided the words TURN \& THE are not in the vocabulary a nd that GO TO THE EAST will mean the same as EAST if the words GO, TO \& THE are not in the vocabulary. Thus it is important to consider which words are excluded from the vocabulary as well asthose which are included.

If no words are recognised the Interpreter gives the reply "I don't understand...". If the Interpreter recognises a word or words, but they neithercause movement (due to no entry in the Movement Table) nor cause an action to be performed (to be explained later) then the Interpreter gives the reply "I can't", if the value of W1 is greater than 12 or "I can't go in that direction", if the value of W1 is less than 13. Therefore the words in the vocabulary which relate to directions should have word values in the range 1 to 12 .

## More Movements

The location descriptions in ouradventure include statements of the form "The Hall is to the West" and up to now we have moved to the Hall with the commandsWEST, W or GO WEST. We are now going to improve the adventure so that it will also obey commands of the form GO TO THE HAL or just HAL. To do this we will need an entry in the vocabulary relating to each location so insert the following entries into the vocabulary.

| HAL | 13 |
| :--- | :--- |
| KITC HEN | 14 |
| DINING | 15 |
| LOUNGE | 16 |
| BEDROOM | 17 |
| CELAR | 18 |

e.g. to insert the word KITCHEN with a word value of 14 use I KITC 14 on the Vocabulary menu. Print the vocabulary to check the entries are correct and then amend the entries in the Movement Table to include these new words. The Movement Table entries required are:-

| Location 0 E1 | D 5 | W 4 | S3 | KITC 1 | CEL 5 | BEDR 4 LOUN 3 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Location 1 S2 | W 0 | DINI 2 | HAL 0 |  |  |  |
| Location 2 N 1 | W 3 | KITC 1 | LOUN 3 |  |  |  |
| Location 3 N 0 | E 2 | HAL0 | DINI 2 |  |  |  |
| Location 4 E 0 | HAL 0 |  |  |  |  |  |
| Location 5 U 0 | HAL0 |  |  |  |  |  |

When you have changed the Movement Table, test the adventure again to check that commands such as GO TO HALL are obeyed corectly. While testing the adventure note that when you are in the Dining Room, GO NE gives the reply "I can't go in that direction" because NE hasa word value less than 13, while GO TO THE HAL gives the reply "I can't" because HALL has a word value greaterthan 12.

## More Words

We will shortly get to the stage where we can begin to manipulate the objects in our adventure. Before we can do that though, the words we will use to manipulate the objects have to be inserted into the vocabulary. Please insert the following entries into the vocabulary:-

| TORCH | 20 |
| :--- | ---: |
| APPLE | 21 |
| KNIFE | 22 |
| TELEVISION | 23 |
| TV | 23 |
| COAT | 24 |
| DEERSTALKER | 25 |
| HAT | 25 |
| KEY | 26 |
| SAFE | 27 |
| J EWEL | 28 |
| STCK | 29 |
| UNLOCK | 30 |
| OPEN | 30 |
| CLOSE | 31 |
| SHUT | 31 |
| LOCK | 31 |
| UGHT | 32 |
| ON | 32 |
| OFF | 33 |
| OUT | 33 |
| EAT | 34 |
| BED | 200 |
| HUNGER | 201 |
| FINISH | 202 |

The bed is not an object in the adventure and we do not intend to make use of the word BED anywhere else in the database. However, the bed is mentioned in the location description of the bedroom so BED is included in the vocabulary to stop the Intepreter replying "I don't understand..." if a player tries to use the bed.

## The Event Table

This table (and the Status Table) form the heart of the database, for it is here that the actions the Interpreter has to take to reply to a player's command are specified. Each entry in the table consists of two word values, a set of conditions and a set of actions. When the adventure is played the Intepreter matchesthe word values entered by the player (which have been stored in W1 and W2) against each entry in the table. If the word values match and the conditions are satisfied then the actions are performed.

Select G on the Main Menu to display the Event Table menu and you will see that entriescan be inserted, a mended orprinted. Printing is slightly different to the other menus because you may either enter $P$ by itself, $P$ followed by one word or $P$ followed by two words and printing will start at the appropriate part of the table. The words used must of course be present in the vocabulary. If you type in $P$ now you will find that a few entries, which will be needed for most adventures, a re already present.

## Action INVEN

This is the action which prints "I have with me:-" etc. The first entry in the Event Table, GETI, has no conditions and a single action called INVEN. What does, this mean? Well if you were playing the adventure and typed in TAKE INVENTORY then, because the word value stored in W1 matched the word value for GETand W2 matched I, action INVEN would be performed. Remember that TAKE \& GETand INVENTORY \& I are synonyms.

The next entry I_does the same thing. If the first word recognised by the Intempreter is a synonym of I then action INVEN is performed. The (underline) means that the corresponding value in W1 orW2 (W2 in this case) is irrelevant. Please make sure you fully understand the last two sections on the Event Table before reading further.

## Action DESC

The third entry in the Event Table R _, means that if R or REDE(SC RIBE) is entered a a a command then action DESC will be performed. Action DESC clears the screen and attempts to describe the current location. (If it is dark the Intempreter will print "Everything is dark. I can't see." ).

## Actions SAVE and LOAD

These are the actions which copy a game position to tape and restore a game position from tape. The last two entries in the Event Table use these actions and mean, for instance, that if LOAD istyped in as a command then action LOAD is performed. Do not be confused by the vocabulary word LOAD and the action word LOAD because they are not related. You can only have an entry in the Event Table of LOAD _ if there is an entry for LOAD in the vocabulary. The action word LOAD is independent of the vocabulary.

## Actions QUIT, TURNS and END

Action QUIT is the action which asks "Are you sure you want to quit now?" while action TURNS is the action which prints "You have ta ken $x$ tum(s).". Action END is a very important action as it prints "END OF GAME Do you want to try again?" and if you reply "N" it retums you to the Editor. Note that the only way to retum to the Editor, after testing an adventure, is by action END being performed.

## Actions GET, DROP and OK

Actions GETand DROP must be followed by an objno. and are used to camy or put down objects while action OK simply prints "OK". In our mini adventure we want the player to be able to take and leave the walking stick using the commands TAKE STICK and DROP STICK respectively. The entries needed in the Event Table for this a re:-

| TAKE STICK | Conds <br> Acts | GET | 11 |
| :--- | :--- | :--- | ---: |
| DROP STICK | Conds <br> OK |  |  |
|  | Acts | DROP <br> OK | 11 |
|  |  | OK |  |

To insert the first of these into the Event Table go to the Event Table menu, type in I TAKE STICK and press ENTER. This inserts a null entry for TAKE STICK (i.e. with no conditions and no actions) in the table and displays a cursor at the bottom of the screen to allow you to a mend the null entry. When the cursor a ppears, type in GET 11 OK a nd press ENTER again. Insert the entry for DROP STICK in the same way and then print the Event Table to check the entries. Notice that the Editor prefers to use the vocabulary word GET instead of TAKE as it is a shorter synonym.

Now test the adventure to see the effect of these entries in the Event Table. In particulartry the following commands:-

| TAKE STICK | when you a re already carrying it |
| :--- | :--- |
| DROP STICK | when you are not camying it |
| GETSTICK | when the stick is at a different location |

## Condition PRESENT

The entries we need, to be able to GET and DROP the other objects a re:-

| Words | Conds | Acts |
| :--- | :--- | :--- |
| GETAPPLE |  | GET2 OK |
| DROP APPLE |  | DROP 2 OK |
| GETKNIFE | GET3 OK |  |
| DROP KNIFE | DROP 3 OK |  |
| GETCOAT | GET5 OK |  |
| DROP COAT | DROP 5 OK |  |
| GETHAT | GET6 OK |  |
| DROP HAT | DROP 6 OK |  |
| GETKEY | GET7 OK |  |
| DROP KEY |  | DROP 7 OK |
| GETJEWEL | GET9 OK |  |
| DROP EWEL |  | DROP 9 OK |
| GETTORCH |  | GET0 OK |
| GETTORCH | PRESENT0 | GET1 OK |
| DROP TORCH | PRESENT0 | DROP 0 OK |
| DROP TORCH |  | DROP 1 OK |

AS you can see the entries for the torch are not quite so simple. The problem is that the torch is really two objects so we have to have two entries. The condition present which must he followed by an objno., checks whether the object specified is present at the current location. So the first entry for GETTORC $H$ checks whether Object 0 is present and if it is, tries to GETit. If Object 0 is not present the condition is not satisfied so the Interpreter falls through to the next entry, which has no conditions and tries to get Object 1. When an entry has conditions and actions the conditions are typed in, in front of the actions e.g. PRESENTO GETO OK.

When you have inserted the entries print them to check they are correct and that the entries for the torch are in the correct order. Amending entries in the Event Table is similar to amending entries in the otherdatabase tables. However, if there is more than one entry present for the same words e.g. DROP TORCH, then each entry is displayed in tum for a mending and you simply press ENTER to leave an entry as it is. Try A DROP TORC on the Event Table menu and keep pressing ENTER until you get back to the menu; both entries should he displayed in tum for possible amending.

Entries in the Event Table can be deleted by removing all the conditions and actionsi.e. Amend the entry using CAPS SHIIT 1 to clear the input buffer and then press ENTER. Before we test the adventure again we'll insert a few more entries.

## Actions WEAR and REMOVE

These actionsenable objectsto be wom and removed and must be followed by an objno. Ouradventure hastwo objects that can he wom and the entries needed in the Event Table for this are:-

Words
WEAR HAT
REMOVEHAT
WEARCOAT
REMOVECOAT

Conds
Acts
WEAR 6 OK
REMOVE 6 OK
WEAR 5 OK
REMOVE 5 OK

Insert these entries and then test the adventure again using diagnostics. The reason for using diagnostics is to enable you to monitor the value of Flag 1 (the second flag) which has a value equal to the number of objectscamied. When you are in the adventure try these commands in the order shown:-

| Command | Response | Flag 1 value |
| :--- | :--- | :--- |
| WEAR HAT |  |  |
| REMOVE HAT | I don't have it | 1 |
| GETHAT | I'm not wearing it | 1 |
| TAKE COAT | OK | 2 |
| KITCHEN | OK | 3 |
| GETTORCH |  | 3 |
| DINING |  | 4 |

| Command | Response | Flag 1 value |
| :--- | :--- | :---: |
| GETAPPLE | I can't camy any more | 4 |
| WEAR HAT | OK | 3 |
| WEAR HAT | I'malready wearing it | 3 |
| GETAPPLE | OK | 4 |
| REMOVE HAT | I can't. My hands are full | 4 |
| DROP HAT | I can't. My handsare full | 4 |
| WEARCOAT | OK | 3 |
| I | I have with me... | 3 |
| DROP HAT | OK | 3 |
| REMOVECOAT | OK | 4 |

Also make sure you can GETthe key a nd drop all the objects you are carying.
As you can see, the actions GET, DROP, REMOVE and WEAR include quite a bit of checking on the objects being manipulated and they can normally be used without being preceded by conditions. These actionsare exceptions to the rule as most other actions will need to be preceded by conditions.

## Action SWAP

This a ction is followed by two objnos a nd simply swa ps over the positions of the two objectse.g. if Object 0 is 'not created' and Object 1 is at location 3 then the action SWAP 01 would put Object 0 at location 3 and make Object 1 'not created'. In our adventure we are going to use SWAP to switch the torch on and off. The entries we need are:-

| Words | Conds | Acts |
| :--- | :--- | :--- |
|  |  |  |
| ON TORCH | PRESENT1 | SWAP 01OK |
| TORCH ON | PRESENT1 | SWAP 01OK |
| OFF TORCH | PRESENT0 | SWAP 1 OK |
| TORCH OFF | PRESENT0 | SWAP 01OK |

Notice that we have catered for a player giving the command SWITCH OFF TORCH or SWITCH TORCH OFF and that the condition PRESENT0 means that the torch can only be switc hed off if the lit torch is present. Insert these entries into the Event table and test them.

## The Rags

The Interpreter conta ins 33 user flags which are really just variables that can hold a value in the range 0255 . Like everything else in The Quill, numbering starts at 0 so the flag numbers (flagnos) are in the range 0-32. There are actions which enable the flag values to be changed and conditionswhich allow the flag values to be tested. Some of the flags have special purposes while others have an auto-dec rement feature. The flags with special purposes are flags $0,1,30,31$ and 32 . Flag 0 is used to tell the interpreter whether it is light or dark; if it has a ny value other than zero the Interpreter thinks it's dark. Flag 1 as we have seen before, holds a count of the number of objects carmed. Flag 30 is used to hold the players score as a percentage while Flags 31 and 32 are used to hold
the number of tums that the player has taken. Flags 2 to 10 are auto-decrement flags which means they are decreased by 1 under certain circ umstances:-

Flag 2 is decreased each time the Interpreter tries to describe a location
Flag 3 is dec reased each time the Interpreter triesto describe a location and it's dark
Flag 4 is decreased each time the Interpreter tries to describe a location and it's dark and Object 0 is absent

Flags 5-8 are decreased each time a command is entered
Flag 9 is decreased each time a command is entered and it's dark
Flag 10 is decreased each time a command is entered and it's dark and Object 0 is absent

Flags 11-29 have no special features
Note that a flag cannot be decreased below zero and that Object 0 is a special object because the Interpreter considers it as a source of light.

There is a summary of the flags and a summary of the conditions and actionsthat can be used, on the last page, of this manual. As mentioned earier, when diagnostic sare requested the values of flags $0-30$ are printed so that you can monitor the values of these flags.

Light and Dark
If you take another look at our map in figure 1 you will notice that it says the cellar is dark. To make the cellardark we will use the condition AT and the actions CLEAR, SET, GOTO and DESC. Condition ATmust be followed by a locno. and is satisfied if the player is at that location. The actions CLEAR and SETmust be followed by a flagno. and change that flags value to 0 or 255 respectively. Action GOTO is followed by a locno. and causes movement to that location.

If this entry were present in the Event Table (do not insert it).

| Words | Cond | Acts |
| :--- | :--- | :--- |
| U_ | AT5 | GOTO 0 DESC |

it would have exactly the same effect as our entry $U 0$ for location 5 in the Movement Table i.e. if a playergives the command UP when he is at location 5 , he is moved to location 4 and the location is described.

The Event Table entriesto be inserted to make the cellar dark are:-

| Words | Conds | Acts |
| :--- | :--- | :--- |
| D |  |  |
| CEŪAR _ | ATO | SET0 GOTO 5 DESC |
| U | AT0 | SETOGOTO 5 DESC |
| HAL̄ _ | AT5 | CLEAR O GOTO O DESC |
| AT5 | CLEAR O GOTO 0 DESC |  |

When a playermoves from the Hall to the Cellar, Flag 0 will be set to 255 (making it dark). When he moves back to the Hall, Flag 0 will be cleared to 0 (making it light again). However, if you were to test the adventure now you would find that the Cellar was still light. This is because the Interpreterchecks the Movement Table before it checks the Event Table and if the Movement Table causes movement the Event Table is not checked. So remove the movements between the Hall and Cellar from the Movement Table and then test the adventure. When you are testing the adventure monitor the value of flag 0 and try experimenting with moving between the Hall and Cellar and switching the torch on and off.

## Action SCORE

The action SCORE prints "You have scored $\mathrm{x} \%$ " where x is the value of Flag 30. We are going to use a very simple scoring system in our adventure where the playerscores $50 \%$ foropening the safe and a further $50 \%$ for completing the adventure. If the player QUITs the adventure he will want to know what score he hasachieved so amend the Event Table entry forQUIT_ so that it has the actions QUITSC ORE TURNS END. It is important that you print this entry (use P QUIT) to check it is corect, because the only way back to the Editor from the Interpreter is by action END being performed.

## Opening and Closing the Safe

In our adventure the safe can only be opened if the key is camied, the lit torch is present and, of course, the safe is not already open. To close the safe, the key is not needed but the lit torch must be present. The first time the safe is opened we want to create the jewel and give the player a score of $50 \%$ but if the player closes the safe and reopens it then we must not create the jewel again orgive another $50 \%$

We will use Flag 11 to show whether the safe has already been opened. As the flags start off with a value of zero we will say that if Flag 11 has the value 0 the safe has not previously been opened. Then if we SETFlag 11 the first time the safe is opened we will be able to tell that the safe has already been opened. The Event Table entries we need are:-

| OPEN SAFE | Conds | PRESENT | 8 |  |
| :--- | :--- | :--- | ---: | :--- |
|  |  |  | CARRIED | 7 |
|  |  |  |  |  |
|  |  | PRESENT | 0 |  |
|  | Acts | ZERO | 11 |  |
|  |  | DESTROY | 8 |  |
|  |  | CREATE | 10 |  |
|  |  | LET | 30 | 50 |
|  |  | CREATE | 9 |  |
|  |  | SET | 11 |  |
|  |  | DESC |  |  |
|  |  |  |  |  |

| OPEN SAFE | Conds | PRESENT | 8 |
| :---: | :---: | :---: | :---: |
|  |  | CARRIED | 7 |
|  |  | PRESENT | 0 |
|  | Acts | DESTROY | 8 |
|  |  | CREATE | 10 |
|  |  | OK |  |
| CLOSE SAFE | Conds | PRESENT | 10 |
|  |  | PRESENI | 0 |
|  | Acts | DESTROY | 10 |
|  |  | CREATE | 8 |
|  |  | OK |  |

Condition CARRIED must he followed by an objno. and is satisfied if that object is camied while condition Z下RO must be followed by a flagno. and is satisfied if that flag has the value 0 . Action CREATE is used to change an object's location to the current location while action DESTROY changes at object's location to 'not created'. Both CREATE a nd DESTROY must be followed by an objno. Action LET is followed by a flagno. \& a value, and the flag is given that value e.g. LET 3050 gives Flag 30 a value of 50 ; a bit like the BASIC command LETFLAG30 $=50$.

The order of the two entries for OPEN SAFE is important. The first time the safe is opened the condition Z्RO 11 will be satisfied so the actions in the first entry will be performed. If the safe is opened again the condition $\mathbb{E} R \mathrm{RO} 11$ will not be satisfied and the interpreter will fall through to the second OPEN SAFE entry. Insert these entries into the Event Table, then print them (use P UNLOCK SAFE) to check they are correct. Note that the first OPEN SAFE entry ends with action DESC so that the playercan see that the jewel has been created. When you have checked the entries test the adventure again and use diagnostic so that you can monitor the value of flags 11 \& 30 .

## The Message Texts

Any messages which are needed in the adventure have to be entered into the Message Text table. The Message Text menu is the same as the Location Text menu with the exception that locno. has been replaced with mesno. (message number). If you select B on the Main Menu to display the Message Text menu and then print the messages, you will see that a message 0 is already present. The messages we need in our adventure are:-

Message 0
I'm hungry!
Message 1
Ah. That's better !
Message 2
I'm dying of starvation...

Message 3
Well done. You've solved the Adventure.
Amend the existing entry for message 0 and then insert messages 1 to 3 .

## The Status Table

This table has exactly the same format as the Event Table i.e. each entry has two word values followed by conditions and actions, but the Interpreter uses the two tables in slightly different ways. We have already seen that the Intepreter uses the Event Table after each command given by a player and matchesthe word values in W1 and W2 with each entry in the table. The Interpreter uses the Status Table in between tums and looks at each entry irespective of the word values in W1 and W2. Thus the Event Table contains entries which are dependent on the commands entered by the player while the Status Table contains entries which are independent of the commands entered by the player. Note that the Intepreter does not make use of the word values present in the Status Table entries. The vocabulary words used in the Status Table can therefore be used as comments, to remind you what the entries do, or to position an entry at a partic ularplace in the table because the entries are a rranged in ascending order of word value. When you write your own adventures you will find that the order of the entries in the Status Table is very important.

## Finishing the Adventure

Our mini adventure is solved when a player is at the Dining Room and the jewel is present. It doesn't matter what commands the player uses to get the jewel to the DINING ROOM so we will use an entry in the Status Table to detect when the adventure is solved. The Status Table entry required is:-

| FINISH | Conds | AT | 2 |  |
| :--- | :--- | :--- | ---: | ---: |
|  |  | Acts | PRESENT | 9 |
|  |  | MESSAGE | 3 |  |
|  |  | PLUS | 30 | 50 |
|  |  | BEEP | 20 | 140 |
|  |  | BEEP | 20 | 160 |
|  |  | BEEP | 20 | 180 |
|  |  | BEEP | 90 | 200 |
|  |  | SCORE |  |  |
|  |  | TURNS |  |  |
|  |  | END |  |  |

Note that the vocabulary word FINISH is used only as a comment.
Select H on the Main Menu to display the Status Table menu and then insert this entry. Action MESSAGE must be followed by a mesno. and simply prints that message. Action PLUS must be followed by a flagno. \& a value, and adds that value to the appropriate flag e.g. PLUS 3050 adds 50 to Flag 30 (the score). Action BEEP is followed by a duration and a pitch; the duration is in hundredths of a second and, like pitch, is in the range of $0-254$. Action BEEP can be considered to execute the BASIC command BEEP duration/100, Pitc h/2-60. Thus the action BEEP 20140 is equivalent to the BASIC command BEEP .2,10.

When you have inserted this entry in the Status Table test the adventure again arid take the jewel to the Dining Room.

## Hunger

In our adventure we want the player to become hungry after 6 tums, to rema in hungry for the next 7 tums and then to die of starvation. Eating the apple, of course, will ward off the pangs of hunger. We will set Flag 12 when the apple is eaten and we will use Flag 5 , which is auto-decremented each tum, to count the 7 tums when the player is hungry. The entries needed in the StatusTable are:-

| HUNGER _ | Conds | EQ | 31 | 6 |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ZERO | 32 |  |
|  | Acts | LET | 5 | 8 |
| HUNGER _ | Conds | NOTIERO | 5 |  |
|  |  | ZERO | 12 |  |
|  |  | Acts MESSAGE | 0 |  |
| HUNGER _ | Conds | EQ | 5 | 1 |
|  |  | Z下RO | 12 |  |
|  | Acts | MESSAGE | 2 |  |
|  |  | PAUSE | 100 |  |
|  |  | BEEP | 20 | 200 |
|  |  | BEEP | 20 | 180 |
|  |  | BEEP | 20 | 160 |
|  |  | BEEP | 90 | 140 |
|  |  | SCORE |  |  |
|  |  | TURNS |  |  |
|  |  | END |  |  |

Note that the vocabulary word HUNGER is only used as a comment.
The condition EQ must be followed by a flagno. \& a value, and is satisfied if the flag specified has the value specified. Condition NOT区RO must also be followed by a flagno. a nd is satisfied if the flag specified does not have the value 0 . The a ction PAUSE is similar to the BASIC command of the same name. Insert these three entries into the Status Table but make sure you insert them in the order shown. The first entry waits until the tums count (Flags 31 and 32 ) is equal to 6 and it then gives Flag 5 a value of 8 . The sec ond entry is the one which prints "Il'm hungry!" a nd it does this when Flag 5 is not zero and Flag 12 says the apple has not been eaten. Flag 5 is a uto-dec remented each tum. The conditions in the third entry are satisfied when Flag 5 reaches 1 and Flag 12 says the apple has not been eaten. Note that when Flag 5 has the value 1 the conditions in both the second and third entries are satisfied so both the messages 'I'm hungry!" and "I'm dying of starvation..." are printed.

## Eating the Apple

We have already said that we will set Flag 12 when the apple is eaten. However, we only want to print message 1 if the apple is eaten when the player is hungry i.e. if the apple is eaten before the player is hungry we just want the reply "OK". The entries required in the Event Table are:-

| EATAPPLE | Conds | PRESENT | 2 |
| :--- | :--- | :--- | ---: |
|  |  | NOTERO | 5 |
|  | Acts | DESTROY | 2 |
|  |  | SET | 12 |
|  |  | MESSAGE | 1 |
| EATAPPLE | Conds | DONE | PRESENT |
|  | Acts | DESTROY | 2 |
|  |  | SET | 12 |
|  |  | OK |  |
|  |  |  |  |

Action DONE simply stops the Interpreter falling through to the next entry in the table. Insert these two entries into the Event (Not Status) table in the corect order.

## Number of Objects Conveyable

You may remember when you were testing the adventure earlier, that the player was able to camy only 4 objects. This numbercan be altered by selecting $P$ on the Main Menu. For our mini adventure change the number of objects conveyable to 1 (one) and then test the adventure for the last time (it won't be quite so easy this time).

## Save and Verify Adventure

These two Options on the Main Menu allow complete copies of an adventure to be saved to tape in a form that will auto-run when loaded into a Spectrum using LOAD"'. Note that the files saved are not designed to be reloaded into The Quill.

## Deleting Words from the Vocabulary

Note that if all the synonyms of a word are deleted from the vocabulary then:-
a) Any entries in the Event and Status Tables using those words are also deleted.
b) Any movements in the Movement table using those words are also deleted.

## Other Actions

All but two of the actions available in The Quill were used in our mini adventure. The other two are MINUS and ANYKEY. MINUS is followed by a flagno. and a value, and subtracts the value specified from the flag specified. Action ANYKEY prints "Press any key to continue" and waitsfor a key to be pressed. One use of ANYKEY is to provide an introduction to adventures. If the introduction occupies two screens, then insert it into the database as the texts forlocations 0 \& 1 and let the adventure properstart at location 2. The following entries in the Statustable can then be used to do the introduction:-

| INTRO | - | Conds <br> Acts | AT <br> ANYKEY <br> GOTO |
| :--- | :--- | :--- | :--- |
|  |  |  | 0 |
| INTRO | - | Conds <br> AESC | AT |
|  |  |  | 1 |
|  |  | ANYKEY <br> GOTO | 2 |
|  |  |  | DESC |

## More about Event and Status

When the interpreter is processing these tables it considers each entry till it reaches the end of the table or it performs one of the actions INVEN, DESC, END, DONE, OK, SAVE or LOAD. The actions QUIT, REMOVE, GET, DROP, a nd WEAR can sometimes also stop processing of the Event/Status tables. Full details of all the actions can be found in Part 2 of this manual.

## Other Conditions

Our mini adventure made use of only 6 of the 16 conditions available in The Quill. Details of the other conditions can be found in Part 2 of this manual but it is worth mentioning the condition CHANCE here as it can introduce a random element into an adventure. Condition CHANCE must be followed by a percentage, in the range 0-99, e.g. CHANCE 25 would have a $25 \%$ chance of being satisfied.

## Designing your own Adventure

The suggested procedure of writing your own adventure is:-
a) Read Part 2 of this manual
b) Draw a map of youradventure and allocate locnos. (make your first adventure a small adventure)
c) List the location texts you will use
d) List the Movement ta ble entries you will need
e) List the objects in the adventure showing where they will start the adventure. Allocate objnos
f) List the messa ges needed in the adventure a nd allocate mesnos
g) List all the words a nd synonyms you will use and allocate word values
h) Decide which flags will be used and what they will be used for
i) Write out all the Event table entries showing the conditions and actions to be used. If you have more than one entry with the same word values check that you have the entries in the correct order
j) Write out all the Status table entries and plan the order of the entries. You might need to add further entries to the vocabulary which will be used as comments in the Status table
k) Insert the entries into the database and save the database regularly (you might get a powercut)
l) Thoroughly test your adventure

As you can see you need to do a lot of planning before you start to type your adventure into The Quill.

## Selling your Adventure

If you intend to sell adventures then they need to be very thoroughly tested by as many people as possible. In partic ular.
a) Check the spelling of every word
b) Check it is impossible to get a score of over $100 \%$
c) Ty to move in every direction from every location
d) Try to GET, DROP, WEAR a nd REMOVE each object
e) It should be possible to solve the adventure each time it is played provided the correct commandsare used e.g. poison gaswhich hasa $1 \%$ chance of appearing and killing the player should be avoided unless you also provide a gasmask.

A great deal of time has been spent testing The Quill but it is possible that a few well hidden bugs still remain within the 7 K of machine code. If you do have any problems please let us know so that they can be corrected. We would also be pleased to hear of any comments or critic isms about The Quill or any suggestions for improvements.

If you intend to sell an adventure written with The Quill we would be grateful if you could mention somewhere in it, that it was written with The Quill.

If you would like us to market an adventure for you, then please send a fully tested copy to:-

## Part 2

## Detailed Description of the Interpreter

The structure of the Interpreter is shown in flowchart 1. The numbers shown on the flowchart relate to the following paragraphs:-

1 Initialise
All the flags are set to zero except for Flag 1 which is set to the number of objects initially caried. The current location and the two word values W1 \& W2 are set to zero.

3 Consider 1st Entry in Status Table
A pointer is set to the first entry in the Status table.
Words \& Conditions Satisfied
The 1st word \& 2nd word in the entry being considered are matched with W1 \& W2 as shown in flowchart 2 . Each condition in the entry is checked asfollows:-

### 4.1 ATlocno.

Satisfied if the current location is the same as locno.
4.2 NOTATlocno.

Satisfied if the current location is different to locno.

### 4.3 ATGTlocno.

Satisfied if the current location is greater than locno.
4.4 ATLTlocno.

Satisfied if the current location is less than loc no.
4.5 PRESENTobjno.

Satisfied if Object objno. is camied or wom or at the current location.
4.6 ABSENTobjno.

Satisfied if Object objno. is not carmed and not wom and not at the current location.
4.7 WORN objno.

Satisfied if Object objno. is wom.
4.8 NOTWORN objno.

Satisfied if Object objno. is not wom.
4.9 CARRIED objno.

Satisfied if Object objno. is camied.
4.10 NOTCARR objno.

Satisfied if Object objno. is not camied.
4.11 CHANCE percent.

Satisfied if percent is less than or equal to a random number in the range 1-100 (inclusive).
4.12 $\mathbb{Z}$ RO flagno.

Satisfied if Flag flagno. is set to zero.
4.13 NOTでRO flagno.

Satisfied if Flag flagno. is not set to zero.
4.14 EQ flagno. value

Satisfied if Flag flagno. is set to value.
4.15 GTflagno. value

Satisfied if Flag flagno. is set to greater than value.
4.16 LTflagno. value

Satisfied if Flag flagno. is set to less than value.

Flowchart 1. Structure of Interpreter

Flowchart 1 on the previous page was spanned across two pages in the original manual.
(Remember this was only A5 sized pages).
So this page would normally have half of the previous flowchart.

Flowc hart 2. Word s \& C onditions Satisfied

A pointer is set to the first action in the entry being considered.
Perform Action
The action is performed as follows:-

### 6.1 INVEN

"I have with me:-" is printed. If no objectsare camied or wom "Nothing at all." is printed, otherwise the object text for each object that is camed or wom is printed. If an object is wom its object text is followed by "(wom)".

Action DONE is then performed.
6.2 DESC

This a ction jumps out of STATUS/EVENTprocessing to Describe C urrent Location.

### 6.3 Q UIT

"Do you really want to quit now?" is printed and the input routine called. If the reply does not start with " $Y$ "action DONE is performed.
6.4 END
"END or GAME Do you want to try again?" is printed and the input routine called. If the reply does not start with N a jump is made to Initialise. Otherwise a jump is made to the Editor (if it is present) or to the BASIC NEW command.
6.5 DONE

This a ction jumpsto the end of STATUS/EVENTprocessing i.e. no more a ctions or entries a re considered.
6.6 OK
"OK" is printed and action DONE is performed.

### 6.7 ANYKEY

"Press a ny key to continue" is printed at the bottom of the screen and the keyboard isscanned until a key is pressed.
6.8 SAVE
"Start ta pe, then press a ny key." is printed at the bottom of the screen. When a key is pressed the game position is saved to tape, then action DESC is performed. If BREAK is pressed during the save a jump is made to Initialise.
6.9 LOAD

Loads data (which should be a game position) from tape, then action DESC is performed. If BREAK is pressed during the load or a tape emor is detected a jump is made to Initialise. If data is loaded which is not a game position a tape error will nomally be detected.
6.10 TURNS

You have taken x tum(s). is printed where x is Flag $31+256$ * Flag 32.

### 6.11 SCORE

You have scored $\mathrm{x} \%$ is printed where x is Flag 30 .

### 6.12 PAUSE value

Pausesforvalue/ 50 secs. However, if value is zero then the pause is for 256/50 secs.
6.13 GOTO locno.

Changes the current location to locno.
6.14 MESSAGE mesno.

Message mesno. is printed.
6.15 REMOVEobjno.

If Object objno. is not wom, "I'm not wearing it." is printed and action DONE is performed.

If the maximum number of objects is being camied (Flag 1), "I can't. My hands are full." is printed and action DONE is performed.

Otherwise the position of Object objno. is changed to 'camied' and Flag 1 is decremented.
6.16 GETobjno.

If Object objno. is wom or camied, "I already have it." is printed and action DONE is performed.

If Object objno. is not at the current location, "lt's not here." is printed and action DONE is performed.

If the maximum number of objects is being camied (Flag 1), "I can't camy any more." is printed and action DONE is performed.

Otherwise the position of Object objno. is changed to 'camied' and Flag 1 is incremented.

### 6.17 DROP objno.

If objno. is wom and the maximum number of objects is being camied (Flag 1), "I can't. My hands are full." is printed and action DONE is performed.

If Object objno. is neither wom nor camed, "I don't have it." is printed and action DONE is performed.

Otherwise the position of Object objno. is changed to the current location and Flag 1 is decremented if the object was camed.
6.18 WEAR objno.

If Object objno. is wom, "I'm already wearing it." is printed and action DONE is performed.

If Object objno. is not camied, "I don't have it." is printed and action DONE is performed.

Otherwise the position of Object objno, is changed to 'wom' and Flag 1 is decremented.
6.19 DESTROY objno.

The position of Object objno. is changed to 'not created' and Flag 1 is decremented if the object was camied.
6.20 CREATE objno.

The position of Object objno. is changed to the curent location and Flag 1 is decremented if the object wascamied.
6.21 SWAP objno. objno.

The positions of the two objects are exchanged.
6.22 SETflagno.

Flag flagno. is set to 255 .
6.23 CLEAR flagno.

Flag flagno. is cleared to 0 .
6.24 PLUS flagno. value

Flag flagno. is increased by value. If the result exceeds 255 the flag is set to 255.
6.25 MINUS flagno. value

Flag flagno. is decreased by value. If the result is negative the flag is set to 0.

Flag flagno. is set to value.

### 6.27 BEEP duration pitch

Executes the BASIC command BEEP duration/100, pitch/2-60.

## 7 Consider Next Action

A pointer is set to the next action in the entry being considered.
8 Consider Next Entry
A pointer is set to the next entry in the table being processed.
Get Command
If Flags 5 to 8 are non zero they are decremented. If it is dark (Flag 0 is non zero) and Flag 9 is non zero it is decremented. If it is dark and Flag 10 is non zero it is decremented if Object 0 is absent.

The tums count (Flags $31 \& 32$ ) is inc remented, one of four messages e.g. "Tell me what to do." is printed and the input routine called. The first four letters of each word in the reply are looked up in the vocabulary and the values of the first two words found in the vocabulary are stored in W1 \& W2.

10 Lookup W1 in Movement Table
The entry in the movement table for the current location is searched to see if the word value in W 1 is present. If it is, the current location is set to the value following W1 in the movement table.

11 Consider 1st Entry in Event Table
A pointer is set to the first entry in the Event table.

The basic structure of the interpreter has its origins in an article written by Ken Reed and published in the August 1980 issue of Practical Computing. The interpreter in The Quill now has little in common with the article but the terms used to describe it (e.g. Status, Event, Flags) have been retained as an aid to people who are familiar with the article.

## Detailed Description of the Database

The database consists of a number of inter-related tablesand also contains an area of misc ella neous information e.g. values of permanent colours, number of objects conveyable. The tables present are:-

A The Vocabulary
Each entry in the table uses 5 bytes and containsa word (orthe first four characters, if the word is longerthan four characters) and a word value in the range 1-254. Words with the same word value are called synonyms. The entries are held in ascending order of word value and within each word value, entries with more spaces come first e.g.

U
UP
CLM
ASCE
where entries with the same word value also have the same number of spaces the entry inserted first comes earliere.g. CLM(B) was inserted before ASCE(ND).

Note 1. Whenever the editor has to convert from a word value to a word it takes the first word with that value.

Note 2. Word valuesless than 13 should be reserved formovement words.
B The Message Text table
This table contains the text of any messages which are needed for the adventure. The messages are numbered from 0 upwards and each one uses 3 bytes plus the length of the text.

C The Location Text table
This table, which has an entry foreach location, conta ins the text which is printed when a location is described. Each entry uses 3 bytes plus the length of the text. The entries are numbered from 0 upwards and location 0 is the location at which the adventure starts. Whenever a new location is inserted a null entry for that location is also made in the movement table.

D The Movement Table
This table has an entry foreach location and each entry may either be empty (null) or contain a number of 'movement pairs'. A movement pair consists of a word value in the vocabulary followed by a location number and means that any word with that word value causes movement to that location. A typical entry could he SOUTH 6 EAST 7 ENTER 6 NORTH 5
which means that SOUTH or ENTER or their synonyms cause movement to location 6, EAST or it's synonyms to location 7 and NORTH or it's synonyms to loc ation 5. Each entry uses 3 bytes plus 2 bytes for each movement pair.

Note 1. The movement pairs contain the word value not the actual word and if a word value is deleted from the vocabulary then all movement pairs which contain that word value are also deleted.

Note 2. When the adventure is being played it is only the first recognised word (W1) which will cause movement.

Note 3. If a ny movements are to be performed in the Event or Status tables using the action GOTO then those movements should be excluded from the Movement table.

The Object Text table
This table, which has an entry for each object, contains the text which is printed when an object is described. Each entry uses 3 bytes plus the length of the text. An object is anything in the adventure which may he manipulated and objects are numbered from 0 upwards. Object 0 is assumed by the Interpreterto be a source of light. Whenever a new object text is inserted an entry of 'not created' is made for that object in the object start location table.

The Object Start Location table
This ta ble hasa 1 byte entry for each object, which specifies the location at which the object is situated at the beginning of the adventure. An object can also start the adventure being wom, carried ornot created.

## G. The Event table

This table (together with the Statustable) is the main part of the database and each entry contains 2 word values followed by any number of conditions and then (normally) at least one action. When the adventure is played, if there is an entry in the table with the word values entered and the conditions specified are satisfied then the actions are performed. The conditions and actionsthat may be present and the effect that they have is fully specified in the description of the interpreter. The order of entries in the table is in ascending order of the first word value. Entries which have the same first word value are held in ascending order of the second word value. Entries with the same first and second word values are held in the order they were inserted into the database (i.e. they must be inserted in the order required). An example of the order of the table, with word values shown in brackets, is as follows:-

| LOOK | $(30)$ | UP | $(9)$ |
| :--- | :--- | :--- | :--- |
| LOOK | $(30)$ | DOWN | $(10)$ |
| LOOK | $(30)$ |  | $(255)$ |
| GET | $(100)$ | $\overline{\text { KEY }}$ | $(16)$ |
| GET | $(100)$ | LAMP | $(26)$ |
| GET | $(100)$ | LAMP | $(26)$ |

Each entry in the table has an overhead of 6 bytes and each condition and a ction uses 1, 2 or 3 bytes depending on the number of parameters.

Note 1. If a word value is deleted from the vocabulary then all entries in the Event and Status tables which conta in that word value are also deleted.

The Status table
This table has exactly the same format as the Event table. When the adventure is played the Status table is scanned between tums to see if the Spectrum wants anything to happen. The Event table can he considered asthe player'stable and conta ins entries which are dependent on the words entered, while the Status table is the computer's table and contains entries which are independent of the wordsentered by the player. The words in the Statustable can however be used to position entries at the required place and/orasa reminder of the purpose of the entries.

## J The Interpreter Messages

This table contains the system messages used by the Interpreter e.g. "I'm not wearing it.". These messages cannot be changed with the Editor. A file is supplied with The Quill which, if loaded using the Load Database command, will change the messages so that "You" is used instead of "l", e.g. "You're not wearing it.". Some people may prefer this format for partic ular adventures.

Files to convert the Interpreter to other languages will be produced if there is a demand forthem.

## Detailed Description of the Editor

A Vocabulary
Words may be, inserted or deleted, synonyms of a word may be displayed or the vocabulary may be printed:-

Insert I word No. (No. is in the range 1-254)
If word is not already present in the vocabulary it is inserted with a word value of No.

Delete D word
If word is present in the vocabulary, it and it's word value are deleted. If synonyms of the word deleted are present in the vocabulary no furtheraction is taken. However, if no synonyms are present, then:-
a) all entries in the Event and Statustables which use this word value are also deleted.
b) all movements in the movement table which use this word value are also deleted.

## Show Synonyms S word

If word is present in the vocabulary, it and all other words with the same word value are, displayed.

## Print $\mathbf{P}$ or $\mathbf{L}$

Printing is either to the screen using $\mathbf{P}$ or to the printer using $\mathbf{L}$
Points to note:
a) Be careful using delete as it can also affect the Event, Status and Movement tables.
b) Words with a word value of less than 13 are assumed to be movement words by the Intempeterand cause the message "I can't go in that direction," to be printed instead of "I can't".

B Message Text
Message texts may be inserted, amended orprinted:-
Insert I
The next a vailable message number is used and a null entry is made for it in the message text table. An automatic call to the amend routine is then made to allow the user to amend the null entry.

## Amend A mesno.

The existing text for message mesno. is copied to the input buffer and displayed at the bottom of the screen for amending. When ENTER is pressed the existing text is replaced with the contents of the input buffer.

## Print P (mesno.) or L(mesno.)

Printing is either to the screen using $\mathbf{P}$ or to the printer using $\mathbf{L}$ Printing sta rts with the text for message mesno. or at the beginning if mesno. is not specified.

Points to note:
a) There is a limit of 255 messages.

C Location Text

Location texts may be inserted, a mended orprinted:-
Insert I
The next available location number is used and a null entry is made for it in both the movement table and the location text table. Processing then continues with an automatic call to the amend routine to allow the user to a mend the null entry already set up in the location text table.

## Amend A locno.

The existing text for location locno. is copied to the input buffer and displayed at the bottom of the screen for amending. When ENTER is pressed the existing entry is replaced with the contents of the input buffer.

## Print P (loc no.) or L(loc no.)

Printing is either to the screen using $\mathbf{P}$ or to the printer using $\mathbf{L}$ Printing sta rts with the text for Location loc no. or at the beginning if loc no. is not specified.

Points to note:
a) The start of an adventure is always at Location 0 .
b) There is a limit of 252 locations.

D Movement table
Movements may be amended or printed:-

## Amend A locno.

The existing entry for Location locno. is decoded, copied to the input buffer and displayed at the bottom of the screen for a mending. When ENTER is pressed the input buffer is vetted to be empty or to conta in word locno. repeated any number of times. word must be present in the vocabulary and loc no. must be present in the location text table. If there are no syntax errors the existing entry is replaced with an encoded copy of the input buffer (i.e. wordschanged to word values).

## Print $\mathbf{P}$ (loc no.) or L(loc no.)

Printing is either to the screen using $\mathbf{P}$ or to the printer using $\mathbf{L}$ Printing starts with the entry for Location locno. or at the beginnings if locno. is not specified.

Points to note:
a) A location text must be present for a Location before movements can be present.
b) Any words in the Vocabulary may be used in the Movement table.
c) When an entry is decoded (for Amend or Print) the word value is changed into the first word in the Vocabulary with that word value.

Object Text
Object texts may be inserted, a mended or printed:-

## Insert I

The next available object number is used and a null entry is made for it in the object text table. An entry of 'not created' is also made for it in the object sta rt location table. Processing then continues with an automatic call to the amend routine to allow the user to a mend the null entry already set up in the object text table.

## Amend A objno.

The existing text for Object objno. is copied to the input buffer and displayed at the bottom of the screen for a mending. When ENTER is pressed the existing text is replaced with the contents of the input buffer.

Print P (objno.) or L (objno.)
Printing is either to the screen using $\mathbf{P}$ or to the printer using $\mathbf{L}$ Printing starts with the text for Object objno. or at the beginning if objno. is not spec ified.

Points to note:
a) Object 0 is considered by the Interpreter to be a source of light.
b) There is a limit of about 210 objects.

Object Start Location Table
The location at which an object is situated at the start of the adventure may be a mended or the object start location table may be printed:-

## Amend A objno. loc no.

The existing entry for Object objno. is replaced with locno. which must either be present in the location text table orbe one of the special locnos. 252 not created, 253 wom or 254 camied.

## Print $\mathbf{P}$ or $\mathbf{L}$

Printing is either to the sc reen using $\mathbf{P}$ or to the printer using $\mathbf{L}$
Points to note:
a) An object text must be present for an object before it's start location can be present.

Event Table

Entries may be Inserted, Amended, Deleted or Printed:-
Insert I word1 word2

Word1 and Word2 must be underline characters or words which are in the vocabulary. The word values of Word1 and Word2 (underline has a word value of 255) are used to find the correct place in the table for the new entry to be created. If any entries already exist for Word1 Word2 then the new entry will be created after the existing entries. A null entry is created at the appropriate place and an automatic call made to the amend routine to allow the user to a mend the null entry.

Amend A Word1 Word2
The first entry in the table with word values of Word1 and Word2 is copied to the input buffer and displayed at the bottom of the screen for a mending. When ENTER is pressed the input buffer is vetted to be empty, in which case the existing entry is deleted, or to conta in a ny number of valid conditions followed by at least one valid action. If there are no syntax errors the existing entry is replaced with the contents of the input buffer. Any following entries in the table with the same word values (i.e. Word1 a nd Word2) are then displayed in tum for amending in the same way.

The conditions that may be used are:-

| AT | locno. |  |
| :--- | :--- | :--- |
| NOTAT | locno. |  |
| ALGT | locno. |  |
| ATLT | locno. |  |
| PRESENT | objno. |  |
| ABSENT | objno. |  |
| WORN | objno.. |  |
| NOTWORN | objno. |  |
| CARRIED | objno.. |  |
| NOTCARR | objno. |  |
| CHANCE | percent | (percent, is in the range 0-99) |
| ZERO | flagno. |  |
| NOTZRO | flagno. |  |
| EQ | flagno. value |  |
| GT | flagno. value | (value is in the range 0-254) |
| LT | flagno. value |  |

The description of the interpreter will tell you what these conditions do. The actions that may be used are:-

| $\theta$ | INVEN |  |  |
| :---: | :---: | :---: | :---: |
| $\theta$ | DESC |  |  |
| $\theta$ | QUIT |  |  |
| $\theta$ | END |  |  |
| $\theta$ | DONE |  |  |
| $\theta$ | OK |  |  |
|  | ANYKEY |  |  |
| $\theta$ | SAVE |  |  |
| $\theta$ | LOAD |  |  |
|  | TURNS |  |  |
|  | SCORE |  |  |
|  | PAUSE | value | (value is $1 / 50$ sec in the range 0-254) |
|  | GOTO | locno. |  |
|  | MESSAGE | mesno. |  |
| $\phi$ | REMOVE | objno. |  |
| $\phi$ | GET | objno. |  |
| $\phi$ | DROP | objno. |  |
| $\phi$ | WEAR | objno. |  |
|  | DESTROY | objno. |  |
|  | CREATE | objno. |  |
|  | SWAP | objno. objno. |  |
|  | SET | flagno. |  |
|  | CLEAR | flagno. |  |
|  | PLUS | flagno. value |  |
|  | MINUS | flagno. value | (value is in the range 0-254) |
|  | LET | flagno. value |  |
|  | BEEP | duration pitch | (duration and pitch are in the range $0-254$. Duration is in $1 / 100 \mathrm{sec}$. The value of pitch is obtained by taking the value you would use in a BASIC BEEP command, adding 60 then multiplying by 2. ) |

The description of the Interpreter will tell you in detail what these actions do. However, please note that the actions marked $\theta$ will always cause an exit from the Event/Status table entry being processed so any following actions will 11 never be performed. The actions marked $\phi$ may cause an exit from the table being processed.

Delete

To delete an entry amend it so that no conditions or actions remain.

## Print P (word1 (word2)) or L (word1 (word2))

Printing is either to the screen using $\mathbf{P}$ or to the printer using $\mathbf{L}$ Printing starts at the first entry with word values of Word1 Word2. If Word1 or Word2 is not specified then a word value of 0 is assumed. Thus $\mathbf{P}$ or $\mathbf{L}$ by itself starts at the beginning of the table.

H Status Table
The Statustable is handled in exactly the same way as the Event Table.
I Save Database
Equivalent to the BASIC command SAVE $f$ Code $m, n$ where $m$ is the start address of the database and $n$ is the length.

J Verify Database
Equivalent to the BASIC command VERIFY f CODE m,n
K Load Database
Equivalent to the BASIC command LOAD f CODE i.e. it will load any file of bytes back to the address it was saved from. As well as loading a database this can be used to load a file of UDG'sprovided they have been saved from the correct address and with a length not greater than 168. This command can also be used to load the file called "You" supplied with The Quill, which will change the Interpreter messa ges so that they use "You" instead of "I".

## Very Important

If BREAK is pressed or a tape error is detected during a load then the database held in memory will be comupt and should not be used as it may comupt the Editor and Interpreter. Under these circumstances the only Editor command which may he used safely is Load Database and this should be used until a database is loaded suc cessfully.

L Test Adventure
"Do you require diagnostics?" is printed and a ny reply that doesn't start with "Y" is assumed to be negative. A jump is then made to the Interpreter. If diagnostics are required then whenever the

Interpreter's input routine is used the bottom four lines of the screen will display the values of flags $0-30$ and the value of the current location. The first of the four lines will conta in the values of flags $0-7$, the sec ond line flags $8-15$ the third line flags $16-23$ and the fourth line flags $24-30$ followed by the value of the current location in inverse. Note that the use of diagnostics will cause the screen to scroll earlier than usual.

## Very Important

The only way back to the Editor from the Interpreter is by performing the action END in either the EVENTor STATUS tables.

Save Adventure
The Interpreter and database arc saved to tape with the file name specified and in such a way that the Adventure will auto run when loaded I rom BASIC using LOAD"'.'"'.

N Venify Adventure
Verifies that an Adventure has been saved correctly
O Bytes Spare
The address of the first spare byte and the number of spare bytes are printed. If the address of the first spare byte is less than 32769 then the Adventure will fit into a 16 k machine.

P ObjectsConveyable
The number of objects that can be carmied at any one time may be set to any value from 0 to 254 . A value less than 10 will normally be used.

Pemanent Colours
The BORDER, PAPER \& INK colours may be set to any valid values. INK 9 (i.e. contrast) is recommended but please note that INK 9 behaves differently in the bottom part of the screen.
(c) Retum to BASIC

Jumps to that BASIC NEW command.

## Editor Eror Messages and their meanings

BREAK BREAK was pressed during a peripheral operation
STOP in INPUT CAPS SHIFT 6 pressed
Tape loading error
as BASIC. Note that a tape error during a LOAD means that the database iscomupt

Database full Insuffic ient room in the database for what you were attempting

Limit reached The maximum number of locations, messages or objects is already present

Out of Memory Entry for Event Status or Movement table is too large for input buffer (very unlikely to occur). The remedy is to use a smaller entry

Note 1 During input the Spectrum will give out a RASP if the screen and/or input buffer is full.

Note 2 If an entry is present in the Database which is too big to fit on one screen, the Spectrum will give out a RASP when the entry is displayed at the bottom of the screen for amending.

Note 3 If an abnomally large entry is inserted in the movement table using abbreviationse.g. N I W 6 S 4 etc and the abbreviations are deleted from the vocabulary, the movement entry (when decoded) i.e. NORTI WEST 6 SOUT 4 etc could be too big for the input buffer. If this happens an out of Memory message will be produced. The remedy is to reinsert the abbreviations in the vocabulary.

## Summary of Conditions, Actions and Fags

| Conditions |  | Actions |  |
| :---: | :---: | :---: | :---: |
| AT | locno. | INVEN |  |
| NOTAT | locno. | DESC |  |
| ATGT | locno. | Q UIT |  |
| ATLT | locno. | END |  |
| PRESENT | objno. | DONE |  |
| ABSENT | objno. | OK |  |
| WORN | objno. | ANYKEY |  |
| NOTWORN | objno. | SAVE |  |
| NOTCARR | objno. | TURNS |  |
| CHANCE | percent | SCORE |  |
| 正RO | flagno. | PAUSE | value |
| NOTLERO | flagno. | GOTO | locno. |
| EQ | flagno. value | MESSAGE | mesno. |
| GT | flagno. value | REMOVE | objno. |
| LT | flagno. value | GET | objno. |
| CARRIED | objno. | WEAR | objno. |
|  |  | DROP | objno. |
|  |  | DESTROY | objno. |
|  |  | CREATE | objno. |
|  |  | SWAP | objno. objno. |
|  |  | SET | flagno. |
|  |  | CLEAR | flagno. |
|  |  | PLUS | flagno. value |
|  |  | MINUS | flagno. value |
