overview of lin-gap	
Gap constraints in SOL101 from version 70.5	
Do not require gap stiffness	◇
No friction considered	◇
Only opening or closing of gaps	◇
Constrain for single d.o.f	◇
Solution by iteration	◇
Rajasekaran Natarajan	3

contact analysis by linear-gap

overview of lin-gap	
Gap constraints in SOL101 characteristics	
The displacement cannot be negative - to Avoid Penetration	◇
the the chosen d.o.f must be perpendicular to contact surface	◇
Chosen d.o.f must be positive in the opening direction	◇
Chosen d.o.f must be positive in the opening direction	◇
Rajasekaran Natarajan	4

contact analysis by linear-gap

solving lin-gap constraints		contact analysis by linear-gap
Gap constraints in SOL101 solution		
Constraints are solved by the iterative technique	◇	
The iteration starts with the random vector of initial state – closed/open	◇	
Solution obtained when – No Penetration/ Tension Forces	◇	
Rajasekaran Natarajan	5	

Why lin-gap not nlgap		contact analysis by linear-gap
Gap constraints in SOL101 Advantages		
Alternative method to solution using Gap in SOL 106	◇	
No Need for Gap Stiffness calculations	◇	
No know-how needed to control nonlinear parameter as in SOL 106	◇	
SOL106 may not converge on some cases and some Initial gap values	◇	
Rajasekaran Natarajan	6	

Why lin-gap not temprod	
Gap constraints in SOL101 Advantages	
No need of manual control and input file parsing on every iteration	◇
Achieved full convergence	◇
The time/effort required is negligible	◇
Fast turnaround time	◇
Rajasekaran Natarajan	7

contact analysis by linear-gap

constraints	
Gap constraints in SOL101 Limitations	
Only constraint displacement non-linearity	◇
No Gap stiffness and no sliding friction	◇
Free-Bodies cannot be analyzed	◇
No constraints changes allowed between sub cases	◇
Solution may not converge	◇
Rajasekaran Natarajan	8

contact analysis by linear-gap

methodology

Penetrating Node 13 N_p

Opening Node 12 N_o

Initial gap opening G_i

Displacement of penetrating Node U_{13} U_p

Displacement of opening Node U_{12} U_o

Actual gap displacement U_g

methodology

MPC Modeling

Actual Gap (U_g) = difference in displacement of (U_{13}) and (U_{12}) + initial gap (G_i)

$$U_g = U_{12} - U_{13} + G_i$$

or

$$U_g - U_{12} + U_{13} - G_i = 0$$

MPC Modeling

$$U_g - U_{12} + U_{13} - G_i = 0$$

Since U_g cannot be dependent and U_{13} is constrained already

$$-U_{12} + U_g - G_i = 0$$

Assign SPOINT 51 for U_g and SPOINT 101 for G_i ◇

Assign SUPORT for U_g ◇

Apply initial gap displacement to G_i ◇

Create MPC using the Relation ◇

Case and bulk cards

Max. No. of Iteration ◇

PARAM,CDITER, <integer>

Print Iteration History ◇

PARAM,CDPRT, <yes/no>

Punch Final Contact Status ◇
